

do this when the baby is hungry or tired. Choose the best times in the day to do this.

Sometimes you may find the baby is very good at spotting the lighted object and at other times he does it poorly. This is typical of a baby who is just beginning to see outline. It will improve daily if you keep at it. Sometimes there is a tendency to want to sweep the lighted object across the baby's field of vision to attract his attention. *Do not do this.* A moving target is a lot more difficult to spot than a stationary one.

Once baby can consistently spot the lighted object, you may move it slowly and let him follow it with his eyes.

Part III—Outline Bit of Intelligence Cards

Thinking and reasoning cannot operate without data or without the sensory pathways to take in that data. Here we introduce the use of special cards, identified by the trademark Bit of Intelligence® cards ("Bit" cards). These "Bit" cards are data. We are able to enhance and grow the baby's visual and auditory pathways and offer him useful and interesting information at the same time.

We begin with simple "Bit" cards, and as the sensory pathways grow the "Bit" cards become more sophisticated visually and intellectually.
